

Semantic Mapping of Object Affordance by Interactive Manipulation

David Inkyu Kim

Gaurav S. Sukhatme

A robot enters a warehouse where it needs to rearrange disorganized boxes

- **Sokoban**
 - Warehouse keeper
 - Arrange boxes in desired positions by pushing
 - Limited action
 - Sequence of action
 - NP-hard problem
 - **Problem for the robot**
 - Understanding the environment
- Understanding object affordances

Assumption

**Without any prior knowledge of
map and objects**

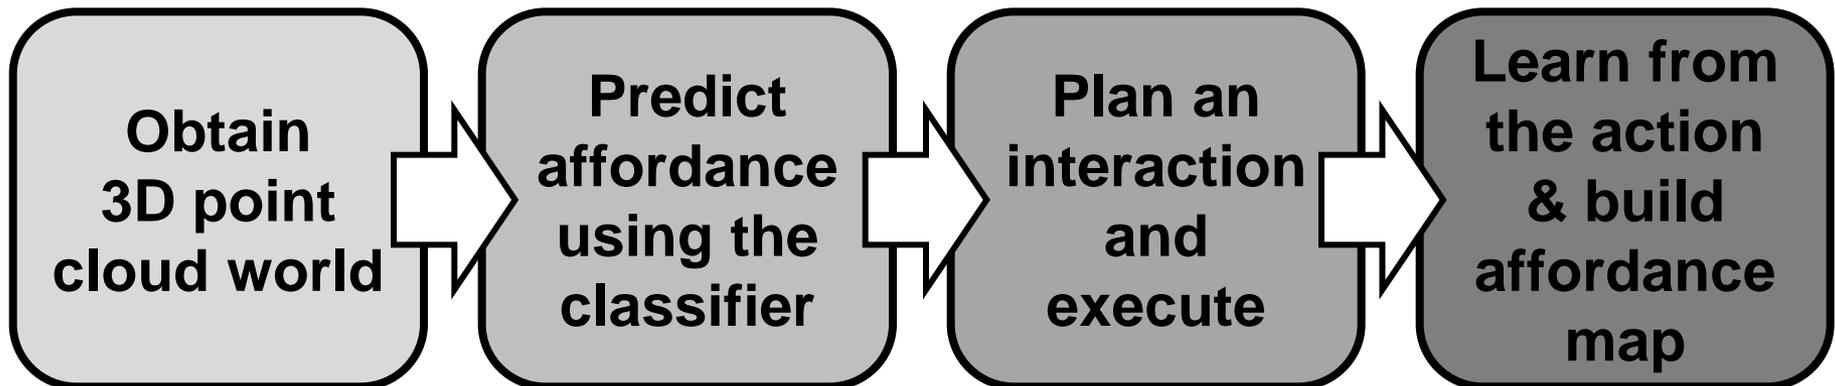

Goal

Build an affordance labeled world map

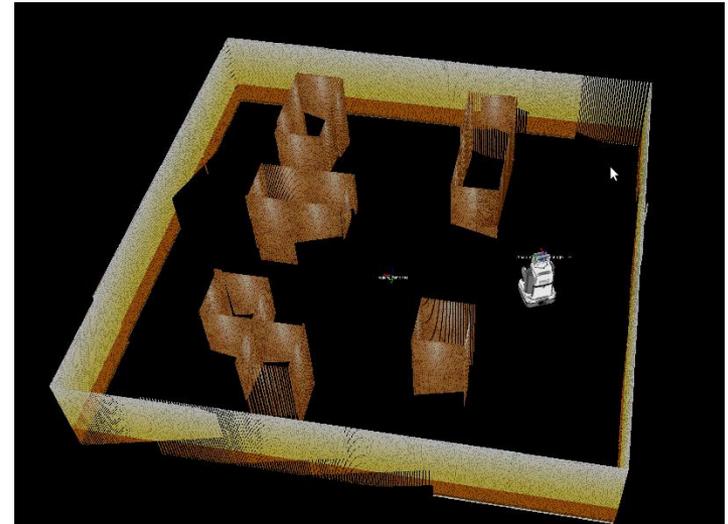

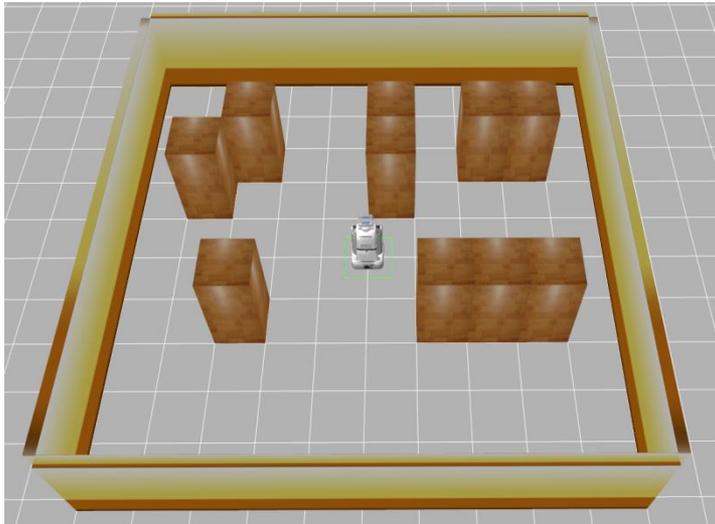

Purpose

A robot to figure out how to rearrange the world

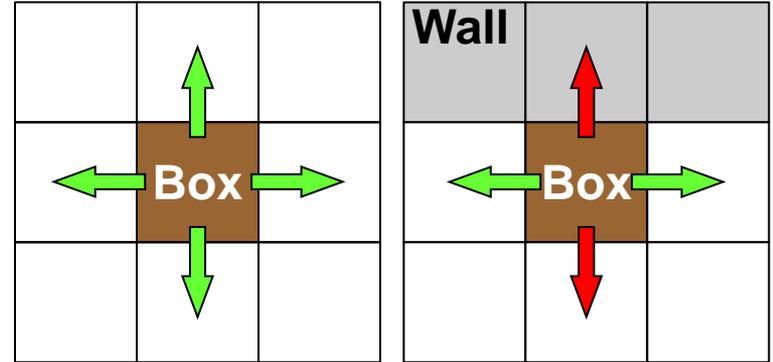

Method

- **3D Point Cloud acquisition**
 - Microsoft Kinect mounted on the head of PR2
- **Grid world mapping**
 - 2D occupancy grid map
 - Frontier-based exploration algorithm
 - Odometry based EKF SLAM

- **Affordance labels**
 - Pushability in 4 directions
 - Unit - one cell
 - Affected by relative positions

- **Prediction** [Kim et al. 2014]
 - Use geometric features
 - Unary features – shape, normal, centroid, span
 - Pairwise features – relative positions of neighboring cells
 - Learn parameters from examples scenes with randomly placed objects
 - Logistic regression
 - Predict each affordance labels

$$f^{\text{label}}(x) = \underbrace{\beta_0^l}_{\text{parameters}} + \sum_{i=1}^n \underbrace{\beta_i^l x_i}_{\text{features}}$$

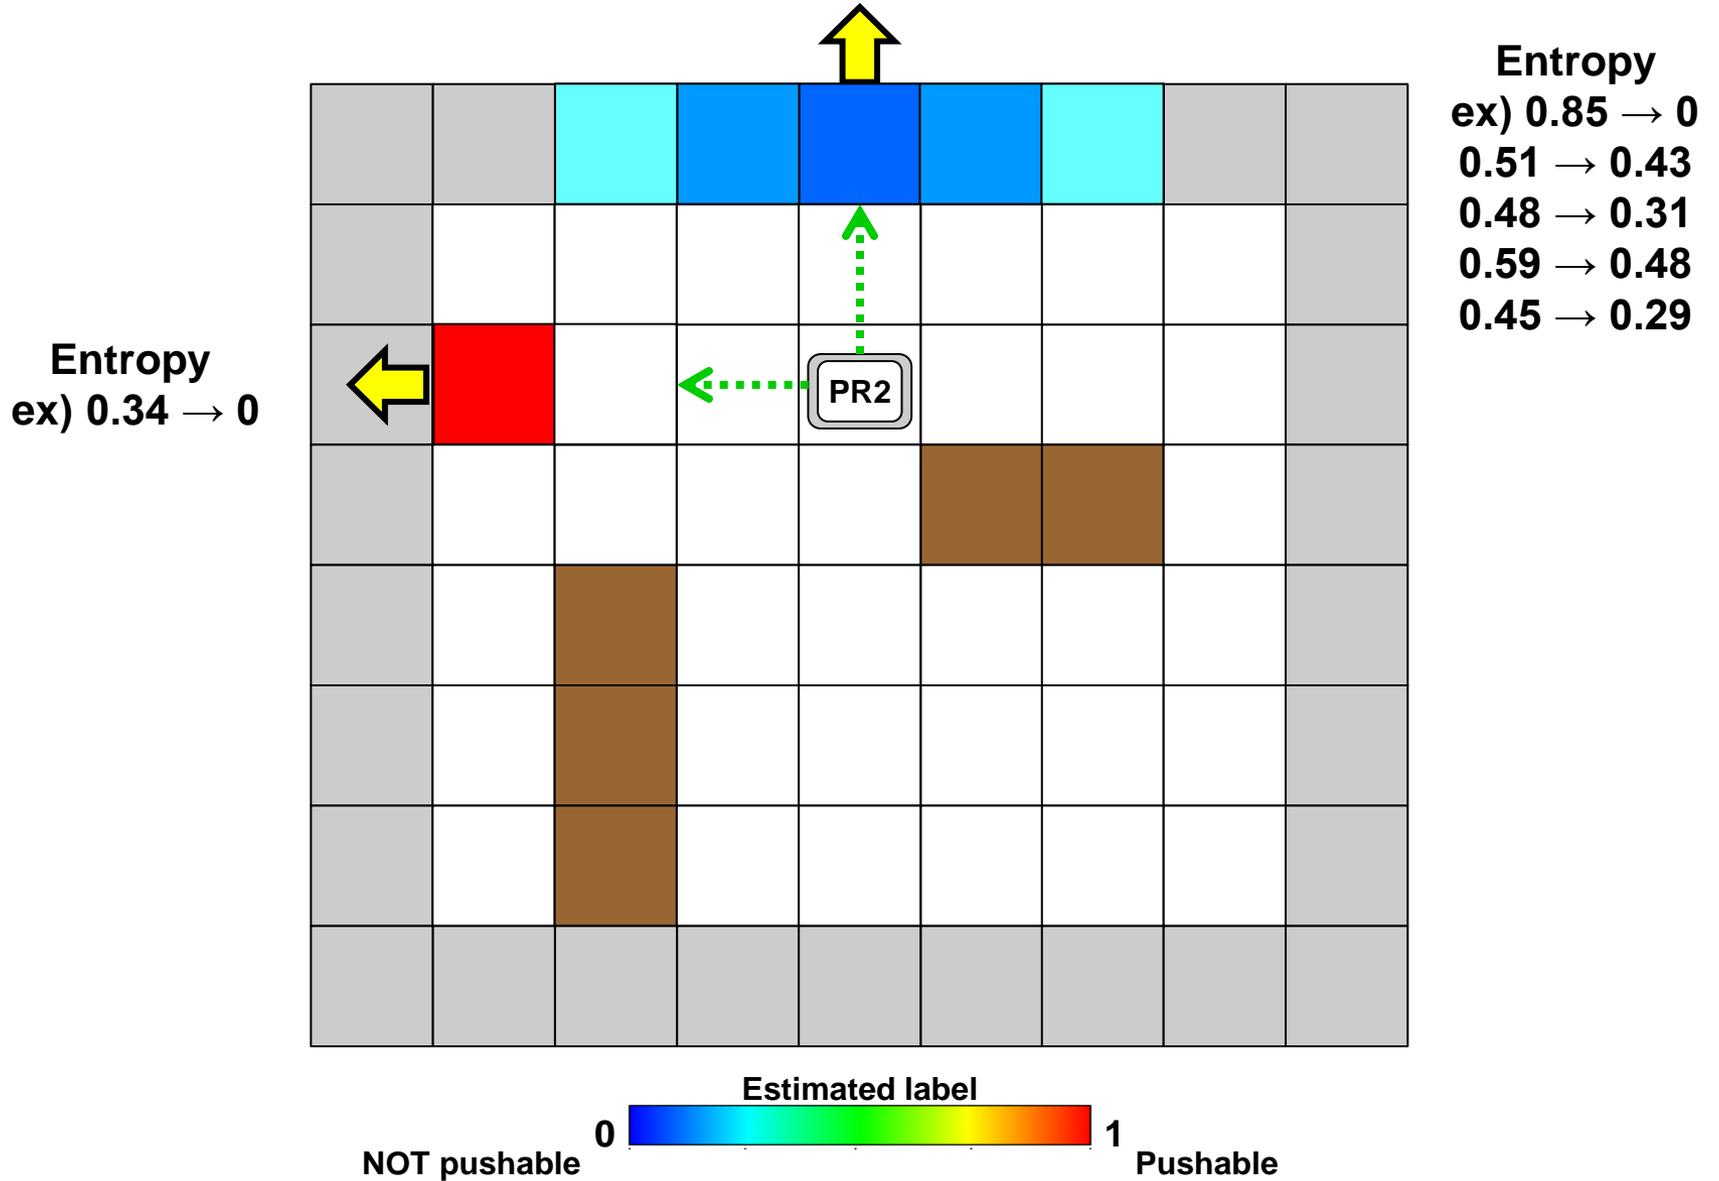

$$p^l(x) = \frac{e^{f^l(x)}}{1 + e^{f^l(x)}}$$

- **Goal**
 - Reduce overall belief entropy of the affordance map
- **Solution**
 - Interact with the object to discover its affordance
 - Learn from the experience and update affordance classifier
- **Approach**
 - Exhaustive manipulation – try to investigate every occupied cell
 - Expectation maximization – choose an action that reveals maximum information
- **Probability distribution of Markov random field**

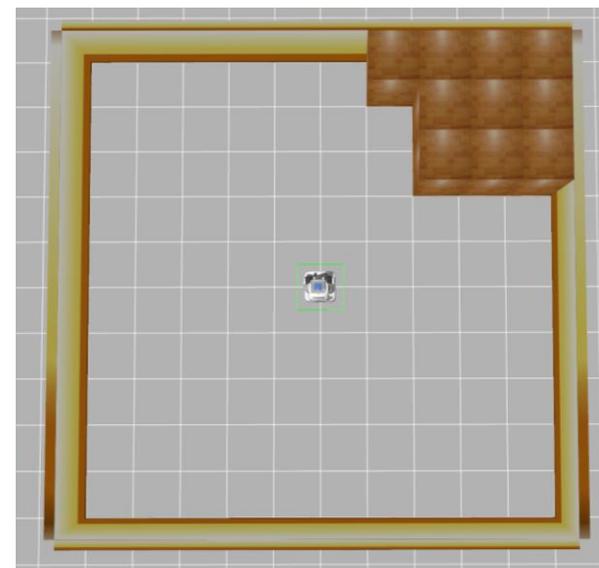

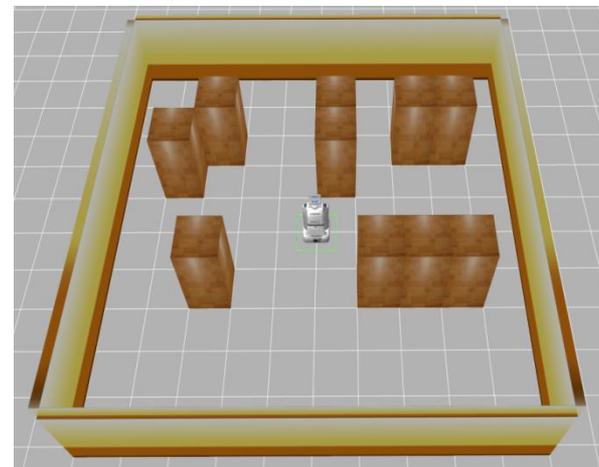

$$P(x_1, x_2, \dots, x_N) = \frac{1}{Z} \prod_{i=1}^N \underbrace{g_i(x_i)}_{\text{Unary Potentials}} \prod_{\langle i,j \rangle} \underbrace{f_{ij}(x_i, x_j)}_{\text{Pairwise Potentials}}$$

- Compute estimated entropy loss of each possible interaction

Example of interactive manipulation USC

- **Settings**
 - Simulated warehouse by Gazebo
 - PR2
 - Microsoft Kinect
- **Training examples**
 - Randomly configured examples with ground truth
 - Learn parameters for both classifier and MRF potentials
- **Goal**
 - Build a 2D grid map of the world
 - Build an affordance map
 - Compare result with different approach for interactive manipulation (e.g. exhaustive vs. expectation maximization)
 - Plan and execute a rearrangement using existing sokoban algorithm

- **Semantic mapping of object affordance for interactive manipulation**
 - Map the world with 2D occupancy grid
 - Predict affordances using geometric features
 - Estimate information gain of possible interaction
 - Train and learn for better prediction and optimal manipulation
- **Future work**
 - Various objects (e.g. household objects) for more generalized planning
 - Complex manipulation of affordances (e.g. pulling, lifting, etc.)
 - Adaptable classifier for different robot configurations

Thank you !!!
